DETAILED ACTION

Allowable Subject Matter

Claims 6-13, 15-20 and 22-27 are allowed.

The following is an examiner's statement of reasons for allowance:

Claim 6 is drawn toward an audio/video recording apparatus for, at the time of recording a set of synchronized video data and audio data as a video object onto a recording medium, recording a reproduction sequence for connecting and reproducing a plurality of video objects in part or in whole onto the recording medium so that the reproduction sequence can be designated, comprising: audio encoding means that performs encoding including a window function multiplying process and an orthogonal transformation process on an audio signal to be recorded and outputs the audio data; video data changing means that changes the video data as necessary so that a video frame to be reproduced last in a video object and a video frame to be reproduced first in the following video object are reproduced seamlessly at a connection point; edition point determining means that determines an edition point in the audio frame so that a period of reproducing an audio frame to be reproduced last in the video object includes time of the connection point of the video frames, a period of reproducing an audio frame to be reproduced first in the following video object includes the time of the connection point, and the period of reproducing an audio frame in the video object and the period of reproducing an audio frame in the following video object partly overlap each other around the connection point; multiplexing means that multiplexes the audio data and the

Art Unit: 2481

video data to generate the video object; control means that controls the multiplexing means so that an audio buffer occupation amount is equal to or less than a value obtained by subtracting a data amount of one audio frame from the upper limit of a specific audio buffer size, and generates a flag indicative of an audio multiplex state at the time of multiplexing by the multiplexing means; and recording means that records the video object output from the multiplexing means controlled by the control means onto the recording medium together with a flag indicative of the audio multiplex state generated by the control means.

Applicant's independent **claim 6** comprises a particular combination that is neither taught nor suggested by the prior art. The closest prior art of record, Okada et al (US Patent 6,263,150) differs from the claimed invention by failing to teach or fairly suggest "the period of reproducing an audio frame in the video object and the period of reproducing an audio frame in the following video object partly overlap each other around the connection point" as well as "control means that controls the multiplexing means so that an audio buffer occupation amount is equal to or less than a value obtained by subtracting a data amount of one audio frame from the upper limit of a specific audio buffer size, and generates a flag indicative of an audio multiplex state at the time of multiplexing by the multiplexing means."

The examiner notes that independent **claims 7, 8, 9, 15, 16, 22 and 24** all contain similar limitations as those deemed allowable in regards to claim 6, and are therefore found allowable in view of the explanation set forth in claim 6 above.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
